

European (EU) Economic Recovery Plan

Plan Summary

This paper recommends monetary reform for the entire European Union (EU) membership including both Eurozone and non-Eurozone countries as the best go forward process for economic recovery and maximising growth. The recommended monetary reform is to convert to a full reserve system based on a GDP monetary standard with seigniorage benefits from GDP growth direct issued to citizens within the EU. This is expected to add approximately 2% to 3% of annual GDP growth to the EU from monetary intermediation cost savings and would eliminate the unnecessary intermediation costs of the ESCB central banking system. The estimated financial impact of the existing fractional reserve monetary system on the EU is estimated to have been €2.23 trillion from 2005 to 2011. Elimination of the estimated €9.07 trillion capitalised cost of the fractional reserve monetary system within the EU is estimated to restore on the order of twelve to fifteen million jobs and retire sovereign debt entirely for all EU member states except Italy, Poland and Romania with those countries debt levels reduced by approximately 65%, 76% and 87% respectively as of 2011. Incomplete banking information was available from Eurostat for Sweden and the United Kingdom, however other information was available to complete alternative estimates of conversion for those countries. Any potentially departing Eurozone member state is recommended to convert to a full reserve system at the time of reinstating its own national currency regardless of any other country within the EU because of the likely full retirement of its national debt as a result of the conversion and expected 3% or more improvement in annual GDP from monetary intermediation savings.

A shared currency supranational GDP based monetary system could be operated at the national level with only supranational agreement required on the monetary standard to be used. It is believed the main economic reason to leave the EU Economic and Monetary Union (EMU) in the future would be failure to maintain the monetary standard at a national level which would eventually require that state to opt out or be put out. It is not believed any supranational banking or fiscal control of member states is required or desirable because it is not believed the added regulatory cost of supranational supervision could be shown to be more economically efficient than a simple option out/put out agreement for countries failing to maintain the GDP monetary standard. Banking regulation would continue to be maintained at the national level and would be removed as a supranational risk for members of the EU from conversion to the full reserve system. It would also be the least disruptive level if a member state ever departs the EU/EMU.

Member states within the EU would maintain their own independent go forward credit ratings but critically a member state default or withdrawal if it were ever to occur would not endanger the financial intermediation system of the EU. Market forces would self govern the ability of states to get into too much debt. Default risk would be limited to the borrowing member state and its lender(s) without endangering the supranational financial system in the event of a sovereign state default. This would protect other EU member state's economies as well as the EU financial system from any potential sovereign state and/or financial institution default.

All member states within the EU are recommended to convert to full reserve currencies based on the intermediation cost savings of full reserve currencies. EU member states are also recommended to continue their current policies regarding joining or not joining the shared Euro monetary system as currency used is not the source of the current EU economic problem.

1. Introduction

The debt based fractional reserve monetary system controlled by the European System of Central Banks (ESCB) is the primary source of the current European economic problem. The ESCB controls the money stock of the seventeen nation Eurozone and an additional ten EU member states with their own national currencies and supplies liquidity to a group of fractional reserve banks for the stated purpose of price stability and credit intermediation. These two main functions of the ESCB have a high intermediation cost, on the order of 2% to 3% of GDP per year¹, compounded to 29% since the introduction of the Euro in 1999, that could be more efficiently handled by a full reserve credit banking system, development of 100% depositor owned institutions to exclusively hold demand deposits and direct issuance of new money creation, known as seigniorage, to the people based on a GDP Monetary Standard.

The ESCB intermediation cost to the EU economy is at least 92%² inefficient with only approximately 8% of the benefits in increases in the money stock going to the people via their national governments. It is believed that with the discovery of the Modigliani-Miller Theorem in 1958 of the irrelevance of capital structure that proof of the superiority of the full reserve system has existed because of its lower intermediation cost³. The improvement to the EU economy is estimated to be on the order of twelve to fifteen million jobs added and improve the balance sheets of EU sovereign governments on the order of €3.8 trillion.⁴

I. Intermediation Cost using Basel II Reserve Requirement System		
European System Central Banks (ESCB) Monetary Issuance \$	€ Amount	Efficiency of Monetary Increase
1. ESCB acquires government issued debt	€ 1,000,000	8.0%
2. Basel II Reserve Requirement (est.) ¹	8.0%	///
3. Money Supply Increase via ESCB Commercial Bank Loans	€ 12,500,000	100.0%
4. ESCB Banks net Increased Loans (Intermediation Cost)	€ 11,500,000	92.0%

TABLE 1 DATA SOURCE: Intermediation Cost Inefficiency Estimate Basel II 8% Reserve Requirement, Attachment 1(b).

II. Direct Monetary Expansion System to People using National Entity		
Direct Monetary Issuance System (Possible Commerce Ministry)	€ Amount	Beneficiaries of Monetary Increase
1. People issued bills directly from Government (Commerce Minis	€ 1,000,000	100.0%
2. People/Government Portion of issued bills	100.0%	///
3. Money Supply Increase to People via Direct Government Issue	€ 1,000,000	100.0%
4. ESCB Banks net Increased Loans (Intermediation Cost)	€ 0	0.0%

TABLE 2 DATA SOURCE: Intermediation Cost Inefficiency Estimate Basel II 8% Reserve Requirement, Attachment 1(b).

Removing the added intermediation expense of the ESCB Monetary Expansion System, while an improvement and risk reduction to the economy, would not address an additional underlying problem, which is the fractional reserve lending system or more appropriately leveraged credit that adds risk to the EU economy without increasing returns to the economy. Any systematic justification for taking on added

⁴ Section 9. Impact on sovereign debt from monetary conversion.

economic risk is that it must add expected return and if it cannot be shown to do so then the added risk is not justified. It is not believed that fractional reserve lending or leveraged credit can show that it adds real or expected return to the system based on the M&M Theorem and therefore the EU should replace it with a more efficient full reserve system that can be operated at a much lower intermediation cost. There is no credit intermediation loss from a full reserve system⁵ and therefore it would absolutely reduce unnecessary leverage risk within the EU, increase returns to the EU by the reduced intermediation cost and more equitably distribute the returns within the EU.

CHART 1 DATA SOURCE: Business Cycle with Leverage and Intermediation Added using Excel Sine Wave Graph.

The chart above shows the impact of fractional reserve leverage, which adds risk to the system in the form of increased variability of returns but does not change returns to the system, shown above as increased amplitudes of the business cycle. The compounding intermediation cost of the ESCB/ECB System is also shown gradually increasing in size that is actually a reduction to system returns.

CHART 2 DATA SOURCE: ECB Eurozone (17) Intermediation Cost 1999 to 2011 using M1 Money Stock, Attachment 6.

⁵ Fractional Reserve Analysis with 100% Reserve Requirement, Attachment 3(c).

The fractional reserve banking system that the ESCB operates under could not survive without subsidy or monopoly protection because the leverage risk it adds to the EU system adds no value and has intermediation cost. Free market competition would out compete fractional reserve banking without intervention and result in a 100% reserve system. 100% reserve institutions would be expected to be 100% depositor owned and third party publicly audited organisations.

ECB Eurozone (17) Monetary Intermediation Cost	€ Billions	% Percent
Economic (GDP) earnings 2011 w/o ECB intermediation expense	€ 9,425.3	100.0%
Economy earnings with ECB Intermediation expense deducted	€ 6,692.9	71.0%
ECB Intermediation Expense to Non Bank Economy since 1999	€ 2,732.4	29.0%

ECB Intermediation costs, primarily monetary expansion inflation, estimated to have consumed (wealth transferred) approximately 29% of eurozone economic returns to banking sector from 1999 to 2011.

TABLE 3 DATA SOURCE: ECB Compounded Intermediation Cost To Eurozone (17) Economy 1999 to 2011, Attachment 7.

CHART 3 DATA SOURCE: ECB/NCB Annual & Compound Intermediation Cost to Economy 2005 to 2011, Supplement 1(a).

A banking business model based on full reserve financial intermediation, time matched funding spread lending, is not a new concept. It has had historical support from at least five previous Nobel Prize winners, Milton Friedman, 1976, James Tobin, 1981, Maurice Allais, 1988, Merton Miller, 1990 and Frederick Soddy, 1921, a former Secretary of Agriculture and Vice President of the United States, Henry Wallace, at least one prominent national central banker, Mervyn King⁶, current governor of the Bank of England and numerous distinguished economists and financial writers listed in Attachment 13 including Irving Fisher, one of the foremost economists of the first half of the 20th Century.⁷

Increases in the money stock would be a matter of elected government public policy at the national level based on EU GDP monetary standards. The accountability link would be restored to the EU system plus the expensive and unnecessary intermediation cost of the ESCB in money creation would be removed with the benefits of lower intermediation costs restored to the people of the EU. The economic system would still be subject to the business cycle but overall the amplitude of the business cycle would be reduced and the damaging ability of the ESCB to artificially redirect capital flows via non-market allocation would be ended. These changes would improve EU economies by 2% to 3% of GDP per year.

2. Inflation monetary intermediation cost issue

When the ESCB system creates new money there is a general belief that it is made out of "nothing" or "thin air". This is not true; money is a medium of exchange and represents value in trade. The aggregate value of money, assuming the money is accepted as a medium of exchange, equals total wealth divided by the total stock of money. If new money is created the total wealth has not changed so the value of the money must be reduced BUT first use and control of the new money is directly vested with the ESCB system indicating a transfer of wealth to the ESCB every time new money is created.

The EU economy is constantly losing and transferring wealth to the ESCB banking system to sustain it, not "thin air" or domestic governments as is widely believed. In this process not only does the ESCB dilute and transfer wealth to itself from the other sectors of the economy but charges the economy additional interest from which the wealth was diluted and taken. The European economy has no benefit from this structure, which is exclusively a transfer of wealth within the system without adding value to the system as a whole.

CHART 4 DATA SOURCE: Fractional Reserve Wealth Transfer and Earned Intermediation Schedule, Attachment 2.

ESCB member banks utilising Basel II reserve requirements are 92%⁸ (1 - applicable reserve requirement) beneficiaries of inflation by virtue of their first use of new money creation with the people and their elected governments involuntarily having their wealth transferred to the banking sector by the same amount since no new wealth has been created. The primary driver of unemployment and wealth inequality in the Europe is the constant inefficient capital transfer to the monetary issuing source.

ESCB intermediation in the monetary creation process is unnecessary and reduces the overall return to the EU economic system by the amount of its intermediation cost, estimated at approximately 2% to 3% of EU GDP per year⁹.

⁸ Intermediation Cost Inefficiency Estimate with Basel II 8% Reserve Requirement, Attachment 1(b).

⁹ ECB/NCB Annual & Compound Intermediation Cost to Economy (using M1) 2005 to 2011 Summary, Supplement 1(a).

3. Confounding the fractional reserve system with credit intermediation

The fractional reserve banking system has been confounded with credit intermediation with material adverse effects on the economy because fractional reserve lending is unearned wealth transfer whereas full reserve lending is earned credit intermediation. The confounding is that these two things appear so closely associated that they are assumed causally related or the same thing.

If fractional reserve lending and credit were causally related or the same thing increasing fractional reserve lending would increase credit available to the system and for temporary periods this can appear to be the case but it is known from the M&M Theorem that leverage does not change the value of the system so the credit of the system cannot be increasing and must be limited and return to the base wealth of the system itself.

Fractional reserve lending has never added value to the system. The entire history of fractional reserve lending will never be able to show that it added value without wealth transfer outside of the lending process to sustain it. It is virtually impossible to see the confounding defect of the system mixing the appearance of true credit lending with the fractional reserve system of lending unbacked credit, effectively nothing. The only thing happening is wealth transfer via inflation and direct bailout from the rest of the system to the fractional reserve lending source with no increase in system value. **Since the fractional reserve source appears to add value via profits it is assumed to add value to the system under the profit motive theory. The profit is 92%+ inflationary wealth transfer from first use of new money creation. The only profit fractional reserve lending has ever made is inflationary wealth transfer from first use new money creation during expansions, foreclosure wealth transfer during credit contractions and direct bailout wealth transfer and has reduced the returns to the system by the amount of its intermediation cost.** To the extent commercial banks may have used time matched funding and lending of their own capital some true credit intermediation was added to the system, but it is small on a relative basis at approximately 8% (1 - Reserve Requirement).

In the fractional reserve lending system wealth transfer is $(\text{Loan Principal} + \text{Interest}) \times (1 - \text{Reserve Requirement})$. Inflation is the Principal portion of wealth transfer. In an 8% reserve system, 92% of the initial loan is inflation wealth transfer with interest repayment as 92% direct wealth transfer without added inflation. In a 100% reserve system there is no inflationary wealth transfer and 100% of the interest earned is true credit intermediation.

An example of direct lending compared to fractional reserve and full reserve lending follows to show the impact of fractional reserve wealth transfer and true credit intermediation. It is composed of Farmer A with a field that a crop is grown on, Farmer B with a Tractor that is rented to Farmer A and a Financial Intermediary that can lend Farmer A the amount of the tractor rent.

Initial Conditions

<u>Item</u>	<u>Value (Initial Condition)</u>

TABLE 8 DATA SOURCE: Fractional Reserve Analysis with 100% Reserve Requirement, Attachment 3(c).

The intermediary does not add value to this system and only has earned income to the extent lending was backed by actual reserves. We know from the M&M Theorem that leverage does not add value to the system so leveraging credit does not add value and the appearance of profit must be wealth transfer.

In the real world Farmer A would not borrow money this way unless he thought he was getting something. Farmer A cannot tell the difference between real credit of Tractor lending and 92% unbacked, 8% reserve financial intermediation.

4. Inability of ESCB policy makers to forecast better than market or GDP index

The ESCB team of economic forecasters is essentially equivalent to active management of mutual funds in the stock market that has been shown to have overwhelming odds against being able to keep pace with an index of the entire stock market.

The annual intermediation cost of the ECB/NCB Monetary System is estimated to be on the order of 2% to 3%¹⁰ to the EU economy, primarily through member bank creation and first use of new money instead of a direct issue system to the people of Europe. It is not believed ECB/NCB monetary policy management is adding value to the EU economy according to the M&M Theorem of capital structure irrelevance so the intermediation cost of the ECB/NCBs must be approximately a 92% (1 - applicable reserve requirement)¹¹ reduction of returns or transfer of wealth to fractional reserve banks in the EU.

In order for active ESCB monetary management to justify itself it would need to add economic performance to the EU by at least the amount of its monetary intermediation cost, which it is not believed it is able to do. It should therefore be replaced with a passive GDP indexed based monetary system with a risk free rate of return or interest rate (r_f), that could be operated at much lower intermediation cost and would increase returns to the EU economic system by the amount of the reduced intermediation cost, on the order of 2% to 3% per year added GDP growth from the improved efficiency of the monetary system.

Jack Bogle, who has written extensively on financial intermediation, has developed a Cost Matters Hypothesis (CMH) that is material to EU/EMU monetary policy:

*“Gross return in the financial markets, minus the costs of financial intermediation, equals the net return actually delivered to investors. While truly staggering amounts of investment literature have been devoted to the EMH (the Efficient Market Hypothesis), precious little has been devoted to what I call the CMH - the Cost Matters Hypothesis. However, to explain the dire odds that investors face in their quest to beat the market we don't need the EMH. We need only the CMH. **Whether markets are efficient or inefficient, investors as a group must fall short of the market return by precisely the amount of the aggregate costs they incur. It is the central fact of investing.**”*

John C. Bogle, Founder of the Vanguard Group, excerpted from his book "Don't Count on It!", 2010, Part One Investment Illusions, Chapter 2 The Relentless Rules of Humble Arithmetic, page 26.

Monetary Intermediation Cost ECB (Estimated using M1)			
Year (End 12/31)	GDP(17)³ (% Growth)	Intermediation (% GDP Cost)	GDP-Intermediation Net (% GDP)
1998			
1999 ^a	4.512%	2.665%	1.847%

5. Optimal quantity of money & GDP growth standard for go forward monetary system

The optimal quantity of money is believed to be the existing amount since it would have the least intermediation cost to change to in a new system. The optimal quantity of money for the go forward monetary system is therefore the amount currently in use.

GDP Based Standard Quantity of Money

It is believed a GDP based monetary standard would be the most efficient standard at this time and be easy to implement and maintained in the Eurozone and non-Eurozone. It could be implemented by taking the current amount of money in circulation in the Eurozone and/or national currency state and dividing it by the applicable current GDP and make that the standard quantity of money per unit of GDP. Increases in GDP would increase the money stock by a matching amount, which would be the risk free rate of return or interest rate (r_f), based on a money quantity per unit of GDP standard. It is believed the narrowest workable monetary measure would be most efficient.

Determination of GDP growth rates for monetary expansion would be completed by an acceptable statistical source such as the European Commission eurostat organisation.

Population Based Standard Quantity of Money

Robert de Fremery makes a strong case in his 1955 book *Money and Freedom* that markets would function most efficiently utilising a fixed standard measure of money and suggests a population based standard¹², which would simply be to take the current amount of money in circulation and divide it by the current population and make that the standard quantity of money per person. Increases in population would increase the money stock by a matching amount of money based on the money quantity per person standard.

A fixed quantity of money per person standard was not proposed at this time because a GDP growth standard provides a revenue source, the risk free rate of return or interest rate (r_f), to fund the non-lending 100% depositor owned depositories proposed in section 7.

¹² *Money and Freedom*, Robert de Fremery, 1955, Ch. 1 "Some Basic Economic Theory Concerning Money", Reference 6.

6. Why gold is not the answer for the monetary system

Gold backing is unnecessary for the monetary system to work efficiently and adds intermediation expense to maintain it in storage.

It is believed a unit of GDP standard would provide better results than a gold standard because it would be easier to maintain and would provide an easily measurable standard for money stock determination. The primary reason gold has been desirable for usage as money was that it had limited availability and was difficult to counterfeit making it a good medium of exchange. The supply of gold is not fixed however, nor is any commodity and therefore the price of the commodity backing the currency will fluctuate in value. Gold also has a history of being debased and because it is a commodity it can have wide value shifts making it unsuitable as a measure of value for medium of exchange use. The feature in its favor is its limited availability, however history has shown that gold based currencies have been debased over time and it is not useful as a standard of value.

With a fractional reserve system the right to convert currency to gold would decrease the money stock by more than the amount of the currency converted. The relationship between gold and the money stock is not one to one but one divided by the fractional reserve requirement percentage. At an 8% reserve requirement, converting €1 to gold would reduce the money stock by €12.50, a twelve and a half to one relationship that is not sustainable so gold offers no currency/money stock/credit availability security at all without a 100% reserve standard.

The observed fact of history is that prices are based on the medium of exchange actually used, not the commodity backing it as evidenced by the historic periodic monetary devaluations of the United States dollar in terms of gold, which did not result in a matching increase in prices in the U.S. economy.¹³

A 100% reserve system does not need any underlying commodity backing the currency as long as there is a standard to determine the amount of currency in circulation, which a GDP monetary unit standard would provide.

¹³ *Money and Freedom*, Robert de Fremery, 1955, Ch. 7 "Shall We Return to a Gold Standard--Now", Reference 6.

7. Transition process to full reserve monetary system

A supranational monetary union with a single and/or multiple currencies could be operated maintaining national sovereignty with the adoption of a GDP monetary standard applicable to all currencies within the union requiring only a common agreement at the supranational level of the monetary standard to be used. A monetary union is not believed to require a fiscal union or a central bank to be highly economically efficient as evidenced by the independent fiscal operation of the individual states within the United States that share a common currency without state level monetary control. Fiscal sovereignty within the EU Economic and Monetary Union (EMU) is expected to be maintained at the national level which is the same level that banking and financial stability supervision is maintained. It would also be the least disruptive level if a member state ever departs the EMU.

It is anticipated the 100% reserve system would be implemented using existing currency and coinage in circulation since the conversion process between the existing and new monetary system would be done in parallel to minimize the intermediation cost of transition.

Commercial banks would be required to divide themselves into two entities, one being a 100% reserve cash only demand depository(ies)¹⁴ that would not make any loans and the other being everything else that the bank does. The conversion process is described below with before and after balance sheets included in Attachments 8(a) to (e).

I. Eurozone (17) Commercial Banking System as of 12/31/2011

II. Eurosystem Consolidated Balance Sheet Conversion Estimate as of 12/31/2011 - Attachment 9

III. Eurozone (17) Central Governments Consolidated Balance Sheets as of 12/31/2011

- A. Before Bank Conversion - Attachment 10(a)
- B. After Bank Conversion - Attachment 10(b)

Non-Eurozone (10) commercial banking system before and after conversion spreadsheets are included in supplemental attachments 2(a) to (d) with central governments in supplemental attachments 3(a) & (b) and economic impact conversion estimates in supplemental attachments 4(a) to (c).

I. Commercial Banking System

Commercial banks would transfer, at no charge or fee, their demand deposit accounts to new independent depositor owned institutions. The accounts would be funded with existing bank cash plus bank holdings of EU sovereign government securities that would be credited to the demand deposit accounts and retired. The remaining fractional reserve shortage of approximately €3.8 trillion in demand deposit funds would be funded by monetary conversion loans from the applicable domestic sovereign government. The monetary conversion loans would be at a market rate for equivalent debt such as Fannie Mae and/or Freddie Mac issues in the United States at an estimated 25 basis points (0.25%) premium over an EU risk free interest rate (r_f), assumed to be the stabilized EU GDP growth rate, which would match the risk free seigniorage rate at the new depositories, and would be repaid as existing loans payoff. The banks would also receive a one-time monetary conversion release of bankruptcy liability due to their fractional reserve

¹⁴ Suggested by among others David Hume in "Of Money", 1752, Reference 14.

demand deposit shortage of funds. The monetary conversion loan would have a laddered maturity structure to match existing loan and/or other asset repayment dates bringing systematic maturities into balance with no anticipated monetary inflation from the conversion process. Government receipts from repayment of the €13.8 trillion monetary loan would be dividended directly to EU citizens depository accounts and/or used to retire any remaining outstanding domestic national debt.

TABLE 10B DATA SOURCE: Non-Eurozone (10) Commercial Banks Consolidated 2011 Balance Sheets, Supplement 2(a).

All government sponsored deposit insurance programs would end at the completion of bank conversion to full 100% reserve institutions. Placing funds with a commercial bank would be expected to have a premium return over the risk free deposit only institutions. Any public insurance of go forward commercial bank CD type deposits would be a credit substitution subsidy and is not needed since risk free depositor owned accounts would be available at the new deposit only institutions.

Any other material deposit taking institutions would have up to three months or an agreed to time period to convert their accounts to timed certificates of deposit or transfer them to a new depositor owned depository.

Commercial banks and other full reserve institutions would handle lending activity based on 100% time matched funds including certificates of deposit, funds raised in the bond market and from what ever other alternative sources of capital that were available to them including lending their own capital. Commercial banks would be expected to operate utilising a maturity matched positive spread funding/lending business model. For example, banks would use their own capital or a five year bond or CD to make a five year loan and charge a spread premium to do so at a lower cost than the borrower could do on their own. The ability of banks to leverage themselves would still be available as in theory a CD could be up to 100% loaned out. Market experience would be expected to determine the level of leverage banks would stabilise around after conversion.

The existing mismatched maturity banking business model is a variation of a market timing strategy of buy low and sell high with demand deposits being buy low assets and loans being sell high assets as opposed to a matched maturity buy and hold strategy, which is the prevailing view in investment theory today. It is believed financial laws of investing are universally applicable and apply to deposit investments within economic systems. Traditional finance, which in a nut shell is to match the duration of liabilities to assets - long to long and short to short, indicates that financing long-term assets with short term liabilities creates non-systematic business risk that can be diversified away by matched funding.

In the United States major financial institutions IndyMac, Washington Mutual, Bears Sterns and Lehman Brothers all failed in 2008 utilising mismatched maturity business models. These are business model risks, not systematic risks that the EU economic system can diversify away with matched funding at zero credit intermediation loss to the system as shown in section 3. There is no downside to conversion from a systematic point of view and the stability and profitability of the banking sector would also be expected to improve from an improved matched funding business model.

Deposit Only 100% Reserve Institutions

The new 100% deposit only institutions would be created out of existing commercial banks and exclusively hold all of the cash demand deposits used in the EU. Bank holdings of EU sovereign government securities would be credited to the demand deposit accounts and retired. The remaining fractional reserve shortage of approximately €13.8 trillion in demand deposit funds would be funded by a monetary conversion loan from the applicable domestic sovereign government. The banks would also receive a one-time monetary conversion release of bankruptcy liability due to their fractional reserve demand deposit shortage of funds.

The new deposit only institutions would be 100% owned by their depositors utilising the Vanguard mutual fund model, with regular annual public audits. The institutions would operate under a Board of Directors composed of elected deposit account holders. The deposit institutions would be expected to generate revenue by developing a debit card network similar to VISA and MasterCard that would have a minimal intermediary charge to cover system costs. A second source of revenue and expected to be the main source would be new money issued, known as Seigniorage, by existing or newly created national Ministries of Commerce, direct deposited on a pro rata basis to demand deposit account holders in accordance with the applicable GDP growth standard.

Expansions of the money stock, based on the GDP growth standard, would be voted on by national parliaments and signed into law by the executive. This process could also be automated requiring national governmental consideration only if the seigniorage payment were to be taxed in some manor. It is anticipated 2% to 4% or more annual increases to the money stock would be made based on a GDP growth standard. The payments would be anticipated to be made payable quarterly in arrears if the economy was expanding and could be called interest or a "Labour Dividend" to reflect that both labour and capital had combined to increase the productivity of the economy during the previous quarter. In the event of a GDP economic decline no interest or "Labour Dividend" would be paid until the economy had returned to net positive growth from the last dividend payment.

Direct issue would be at least a 92% improvement in the intermediation process of adding money to the EMU system and should have immediate and long-term positive improvements to the economy by virtue of the reduced intermediation cost. The risk free rate of return or interest (r_f) or "Labour Dividend" could be taxed, if necessary, at the time of issuance or taxed as a regular dividend or exempted as the increased money in circulation would be expected to increase revenues to domestic governments by the same approximate percentage as the increase of the "Labour Dividend".

A single seigniorage interest rate (r_f) would apply for the Eurozone with national currencies having their own rates until joining the Eurozone. Variations in GDP growth rates would appear to favor some countries outside the Eurozone in the short run with higher seigniorage payments but current financial theory of the efficient frontier of the indexed Eurozone approach¹⁵ indicates that long-term all members

¹⁵ Brealey, Richard, and Myers, Stewart, *Principles of Corporate Finance*, 1981 Chapter 8 "Risk and Return", pp. 134-152, Ref. 4.

would share equally in the benefits of growth and that variations in national GDP and growth rates other than the Eurozone rate could only be maintained by exposure to added market risk that could be diversified away by joining the Eurozone. Depositors could only achieve higher seigniorage rates by adding uncompensated exchange rate risk to the risk free return available in their currency area. It is expected that investment capital would be attracted to high GDP growth areas to rapidly decrease variations in EU GDP per capita. It is also expected there will always be some variation and shifting of GDP among the nations within the EU from natural market activity. It is not believed there is any economic benefit without matching added risk for any country to delay entering the Eurozone currency union.

A sample of how the system would have operated within the Eurozone for the last ten years along with a comparison showing actual M1 Money Stock growth is included in the two charts below along with a table showing the source numbers. M1 was selected for this example, any actual system would have to have an agreed upon measure of the money stock such as M_1 , M_2 , M_3 or some other well defined monetary measure. The total of demand deposits held at the proposed demand depositories could serve as the monetary standard. GDP is assumed to be the measure for economic performance.

CHART 5 DATA SOURCE: Direct Issuance and First Use (Seigniorage) Money Stock, Attachment 12.

CHART 6 DATA SOURCE: Direct Issuance and First Use (Seigniorage) Money Stock, Attachment 12.

The size of the new 100% reserve demand deposit institutions is expected to be limited so that none are able to grow large enough to present any systematic risk. A preliminary estimate is that no deposit only institution should be allowed to grow larger than 1% to 1½% of total system monetary assets and that would be a factor to consider at the time of creation of the depositor owned institutions.

Cash demand deposit holding institutions will face overwhelming temptation to lend deposits based on what has happened in history. Probably the most well known case is the Bank of Amsterdam, which started as a 100% reserve institution in 1609 that went for years without audit and failed in 1790¹⁶ after undisclosed lending activity was revealed requiring governmental/public support, effectively the public bailing itself out with added intermediation costs to boot, and from then on the bank declined and was closed in 1819. Therefore any institution holding cash deposits must be chartered to have deposit accounts fully owned by their depositors and never lend money or credit under any circumstances including even overnight lending. There would be no government provided deposit insurance because all deposits would be backed 100%. Protection of the depositor's accounts would be provided by the deposit owners themselves, utilising the Vanguard mutual fund model, with regular annual public audits.

Residents within the EU are anticipated to desire to hold their funds in some combination of both the risk free depository system and commercial banking system and that the most efficient way to handle this would be for the selection to be made at the individual citizen level.

II. European Central Banking (ESCB/Eurosystem/ECB/NCB) System

All central banks within the ESCB would be divided into two parts in the same manner as commercial banks with the ECB being divided by its capital key and distributed to the National Central Banks (NCBs). The deposit only portion of the NCBs would be assigned to national Treasury Ministries and assist with the financial operations of the national governments. The remaining operations of the central banks would be assigned to existing or newly created Ministries of Commerce with most functions sunseting, meaning outstanding activities would not be renewed as they matured and were paid off.

The ability of the central banks to create unlimited uncollateralised lines of credit¹⁷ to increase the money stock would be ended and lender of last resort would also be ended as no longer needed for systematic stability. Euro notes would be converted at par by book entry retirement of Eurosystem monetary assets with new Euro bill currency issued and backed by the people of the Eurozone. Remaining national currency countries would do the same with their NCB monetary assets. Existing Euro and national currency would continue in circulation since the conversion would be at par and replaced as part of routine currency maintenance to minimise the cost of the conversion process.

ESCB check processing functions could be assigned to the new system of demand depositor owned institutions which would be expected to develop a network for processing checks and debit card transactions to finance their operations. ESCB check processing functions could also be assigned and/or divided among the remaining commercial banking organisations. It is believed the transaction network of the depositories should be maintained entirely separately from the commercial banking network.

III. EU Member National Governments

Monetary policy would be transferred to the Legislative Branch to be signed into law and administered by the Executive Branch, believed to be most naturally a function of the Ministry of Commerce. Increases in money stock to be handled in traditional legislative manner based on a GDP standard and administered by the Ministry of Commerce or closest related entity within the national government

Member states within the EU would maintain their own independent credit ratings but critically a member state default or withdrawal if it were ever to occur would not endanger the EU financial system as a whole. Market forces would self govern the ability of states to get into too much debt and the default risk would be limited to the borrowing member state and its lender(s). This would protect other EU member states economies as well as the EMU financial system from any potential sovereign state and/or financial intermediation institutional default.

A. Commerce Ministries

Existing or newly created Ministries of Commerce would maintain the money stocks for the depositories contained within their national borders and increase it by the net positive GDP growth of the applicable Eurozone or national economy. Ministries of Commerce would maintain domestic bank regulatory activity going forward and assume any remaining non-demand deposit operations of the sunseting NCB.

B. Treasury Ministries

The mission statement of Treasury Ministries would be defined to manage national government finances and resources effectively. Managing government accounts, public debt, revenue collection and tax policy would be the functions of the Treasury Ministries. The deposit only portion of the national NCB would be assigned to the Treasury Ministry and assist with the financial operation of the federal level government.

8. Impact on international euro denominated contracts, private savings & domestic mortgages

International contracts denominated in euros are expected to remain in force without change. Private savings and domestic mortgages are also expected to be unaffected.

The banking sector will not experience any reduction in true credit intermediation profit only the loss of unearned wealth transfer that the fractional reserve system provides. Full reserve banking is expected to increase the stability of the banking system by removing mismatched asset/liability risk from current banking fractional reserve balance sheets.

The efficiency of the economy is expected to improve by the reduced intermediation cost and permanently remove the fractional reserve banking sector as a systematic risk to the go forward EU economy. The efficiency of credit intermediation, allocation of capital and rate of increase of standard of living are all expected to improve by the amount of the reduced monetary intermediation cost, approximately 2% to 3% of GDP per year¹⁸.

¹⁸ ECB/NCB Annual & Compound Intermediation Cost to Economy (using M1) 2005 to 2011 Summary, Supplement 1(a).

9. Impact on sovereign debt from monetary conversion

The one-time conversion of fractional reserve deposits to full reserves will require EU banks to fully use their holdings of sovereign debt to be credited to funding their demand deposit liabilities. Additionally EU banks will need to borrow an approximate €13.84 trillion from EU sovereign governments to fully fund their demand deposit liabilities. The tables below ignore ECB holdings of sovereign debt that is expected to also be credited to 100% reserve deposit funding and retired, which would reduce the net bank loans but keep the same approximate sovereign benefit. The expected result of the conversion process is that most countries will have their sovereign debt fully retired with additional bank loan balances that would need to be retired upon repayment to keep the monetary system in balance and remove any inflationary impact from the conversion process.

TABLE 13 SOURCE: Sovereign Debt Impact from Fractional Reserve Banking Monetary Conversion, Supplement 4(b).

10. Impact on economy and jobs from monetary conversion

Restoring the intermediation cost of the ESCB Fractional Reserve Monetary System to the EU member states economies is expected to improve the economies by the amount of the reduced intermediation cost, approximately 3% per year.

The ESCB Fractional Reserve System has a 92% (1 - Reserve Requirement¹⁹) intermediation cost (wealth transfer effect) of new money creation, which is a loss of capital from the other sectors of the economy. Assuming a €750,000 of capital value per job creation, the total €9.07 trillion estimated capitalised intermediation cost represents an estimated 12,095,000 private sector jobs. Per NY Times 2009 €24,052 estimate, the €362.9 billion annual cost would be approximately 15,086,000 jobs. These estimates indicate the approximate intermediation cost of the ESCB Fractional Reserve Monetary System is on the order of twelve to fifteen million recoverable jobs from conversion to a full reserve monetary system.

11. How future financial emergencies would be handled

The same way they are handled now. What would change is the intermediation cost of introducing new money into the financial system. With a full reserve system there would no longer be deposit bank failures so the financial system would no longer be at risk. Much financial regulation could be retired since it would no longer be applicable, which should also improve economic system performance.

Sovereign state governments within the EU would handle emergencies by getting legislative approval signed into law by their executive in the following estimated order priority:

- 1) Traditional taxation,
- 2) Issue debt to the general market in the form of bonds, and
- 3) Taxing GDP monetary seigniorage payments issued to the people within their states with up to a 100% tax rate.

It is believed virtually all emergencies would be covered by traditional taxation and debt issuance. Once monetary seigniorage is issued directly to the people in item 3) it could be taxed in an emergency situation.

Insurance Companies Operating on the Fractional Reserve Business Model

Insurance providers are not part of the monetary system but do also operate utilizing the fractional reserve business model, usually 10% to 12%, meaning that a large loss all at once can result in losses of more than available reserves such as occurred to AIG, one of the world's largest insurance companies, in 2008. Insurance based on the fractional reserve model operates on the same principle as fractional reserve banking and does not add any systematic value in excess of reserves as shown in section 3. Therefore there should be no public insurance of private insurance companies because it is exclusively a wealth transfer with no value added to the economic system. All policy non-payment risk should be assumed by the policyholder as part of the due diligence process of purchasing insurance. Alternatively, insurance companies could be required to have the same full reserve capital requirement since the same fractional reserve wealth transfer principle applies. Writing a \$1 million policy would require \$1 million of matching at risk capital. The insurance company business model risk should be limited to the insurance industry and their customers and not continue as a systematic risk for the whole EU economy.

12. Conclusion

Economic recovery for European Union member states from the current debt based financial crisis begins with conversion to full reserve monetary systems with direct issuance of new money creation, known as Seigniorage, to the people within their respective countries based on a GDP growth standard. At least five previous Nobel Prize winners, Milton Friedman, 1976, James Tobin, 1981, Maurice Allais, 1988, Merton Miller, 1990 and Frederick Soddy, 1921 along with Irving Fisher, one of the foremost economists of the first half of the 20th Century have all supported full reserve monetary systems²⁰. Conversion to a full reserve monetary system is estimated to improve the balance sheets of EU governments on the order of \$13.8 trillion²¹ as of fiscal year 2011 and restore on the order of twelve to fifteen million jobs.

Replacing the European System of Central Banks (ESCBs) with a 100% reserve system and GDP based monetary standard would lower the intermediation cost of the monetary system by over 92%²². Unfair and unequal discretionary bailouts of some companies and not others would be eliminated and critically the constant involuntary wealth transfers from the other sectors of the EU economies to the banking sector by the ESCBs ability to create unlimited uncollateralised lines of credit would also be eliminated.²³

Returning control of monetary policy to the people of Europe would restore transparency and accountability to the citizens and taxpayers of EU member states. Unnecessary monetary debt that destabilizes EU economies via leverage and also adds unnecessary intermediation cost since no value is added from ESCB money creation and fractional reserve banking activity and therefore lowers returns to EU member state economies by the amount of its intermediation cost.

As shown in Section 3 there is no credit intermediation loss with a full reserve system and there would be a more efficient allocation of capital and economic returns reducing and/or eliminating the current wealth transfer disparity caused by the fractional reserve system. It is believed that with the discovery of the Modigliani-Miller Financial Theorem in 1958 of the irrelevance of capital structure that proof of the superiority of the full reserve system has existed because of its lower monetary intermediation cost. The improvement to the EU economy is expected to be the approximate amount of the reduced monetary intermediation cost, on the order of 2% to 3% of GDP per year²⁴.

EU Economic Recovery Plan
ECB Intermediation Cost Inefficiency Estimate
(with Wealth Transfer Effect)

I. Intermediation Cost using ECB Reserve Requirement System		
European Central Bank (ECB) Monetary Issuance System	€ Amount	Efficiency of Monetary Increase
1. ECB acquires government issued debt	€ 1,000,000	2.0%
2. ECB Reserve Requirement (est.) ¹	2.0%	
3. Money Supply Increase via ECB Commercial Bank Loans	€ 50,000,000	100.0%
4. ECB Banks net Increased Loans (Intermediation Cost)	€ 49,000,000	98.0%

People/Gov't Benefit
Intermediation Cost

Intermediation Cost Inefficiency Utilizing European Central Bank (ECB) Monetary System

With the European Central Bank's approximate 2% fractional reserve lending requirement, 98% of the money supply increase is in the form of new ECB member bank loans with 2% of the increase to the government from new debt issuance indicating that the cost of using the European Central Bank's monetary expansion system as an intermediary to increase the money supply is 98%. The money supply increase dilutes the existing money stock and transfers wealth from the other sectors of the economy to the banking sector by the amount of the money supply increase. Money creation and first use, known as seigniorage, by the ECB is equivalent to 98% direct wealth transfer.

II. Direct Monetary Expansion System to People using National Entity		
Direct Monetary Issuance System(Possible Commerce Ministry)	€ Amount	Beneficiaries of Monetary Increase
1. People issued bills directly from Government(Commerce Ministry)	€ 1,000,000	100.0%
2. People/Government Portion of issued bills	100.0%	
3. Money Supply Increase to People via Direct Government Issue	€ 1,000,000	100.0%
4. ECB Banks net Increased Loans (Intermediation Cost)	€ 0	0.0%

People/Gov't Benefit
Intermediation Cost

Intermediation Efficiency Increase with Direct Issuance of Currency

With direct issuance of money supply increases to the Eurozone people and/or people holding Euro denominated demand deposit accounts, anticipated to most naturally be voted on by national governments based on a Eurozone GDP standard and administered by their Ministries of Commerce, 100% of the increase in the money supply goes direct to the European people with no intermediation loss. Direct issuance of money supply increases eliminating the intermediation cost of the ECB would be at least 98% more efficient than the current ECB system and eliminate the wealth transfer to the banking sector issue. If necessary states within the Eurozone could tax the new money seigniorage at issuance to the people, as a regular part of their income tax collection process or exempt since goes into economic system subject to regular taxation.

Basel II Intermediation Cost Inefficiency Estimate
(with Wealth Transfer Effect)

I. Intermediation Cost using Basel II Reserve Requirement System		
European System Central Banks (ESCB) Monetary Issuance \$	€ Amount	Efficiency of Monetary Increase
1. ESCB acquires government issued debt	€ 1,000,000	8.0%
2. Basel II Reserve Requirement (est.) ¹	8.0%	
3. Money Supply Increase via ESCB Commercial Bank Loans	€ 12,500,000	100.0%
4. ESCB Banks net Increased Loans (Intermediation Cost)	€ 11,500,000	92.0%

People/Gov't Benefit
Intermediation Cost

Intermediation Cost Inefficiency Utilizing European System Central Banks (ESCB) Monetary System

With the Basel II approximate 8% fractional reserve lending requirement (European Central Bank's 2% fractional reserve lending requirement), 92% of the money supply increase is in the form of new ESCB member bank loans with approximately 8% of the increase to the government from new debt issuance indicating that the cost of using the ESCB Basel II monetary expansion system as an intermediary to increase the money supply is 92%. The money supply increase dilutes the existing money stock and transfers wealth from the other sectors of the economy to the banking sector by the amount of the money supply increase. Money creation and first use, known as seigniorage, by the ESCB with Basel II reserve requirement is equivalent to 92% direct wealth transfer.

II. Direct Monetary Expansion System to People using National Entity		
Direct Monetary Issuance System(Possible Commerce Ministry)	€ Amount	Beneficiaries of Monetary Increase
1. People issued bills directly from Government(Commerce Ministry)	€ 1,000,000	100.0%
2. People/Government Portion of issued bills	100.0%	
3. Money Supply Increase to People via Direct Government Issue	€ 1,000,000	100.0%
4. ESCB Banks net Increased Loans (Intermediation Cost)	€ 0	0.0%

People/Gov't Benefit
Intermediation Cost

Intermediation Efficiency Increase with Direct Issuance of Currency

With direct issuance of money supply increases to the European people and/or people holding demand deposit accounts, anticipated to most naturally be voted on by national governments based on a National GDP standard and administered by their Ministries of Commerce, 100% of the increase in the money supply goes direct to the national people with no intermediation loss. Direct issuance of money supply increases eliminating the intermediation cost of the ESCB would be at least 92% more efficient than the current Basel II system and eliminate the wealth transfer to the banking sector issue. If necessary states within the Economic and Monetary Union (EMU) could tax the new money seigniorage at issuance to the people, as a regular part of their income tax collection process or exempt since it goes into economic system subject to regular taxation.

10.0%	90.0%	90.0%	90.0%		10.0%
20.0%	80.0%	80.0%	80.0%		20.0%
30.0%	70.0%	70.0%	70.0%		30.0%
40.0%	60.0%	60.0%	60.0%		40.0%
50.0%	50.0%	50.0%	50.0%		50.0%
60.0%	40.0%	40.0%	40.0%		60.0%
70.0%	30.0%	30.0%	30.0%		70.0%
80.0%	20.0%	20.0%	20.0%		80.0%
90.0%	10.0%	10.0%	10.0%		90.0%
100.0%	0.0%	0.0%	0.0%		100.0%

Notes:

- 1-A 100% reserve requirement does not mean a credit intermediary would not be able to lend, it means the intermediated credit, say a 5-year loan, would need to be 100% time matched with 5-year funds such as a 5-year certificate of deposit with the credit intermediary making a spread profit. Credit intermediary would also be able to lend their own capital without restriction and leverage on time matched basis up to 100%.
- 3-It is not possible to have credit intermediation on demand deposits, even overnight funds lending, because the funds can be withdrawn at any time and must be 100% available. Any and all lending of third party demand deposits is 0% credit intermediation and 100% wealth transfer to the lender system from the borrower system. Mismatched maturities implies a market timing strategy by lender, not considered modern financial theory.
- 4-To avoid the temptation to loan demand deposits, checking accounts and accounts subject to debit card withdrawals, it is believed new deposit only institutions should be created that are 100% owned by the depositors themselves so that if deposits are ever lent resulting in a loss that the depository owners would experience 100% of the loss without impacting the rest of the deposit only system. There would be no insurance for this type of loss, it would be up to the deposit owners to operate their depositories to protect their own money. Protection would come from a depositor owned board of directors and regular public audits. It is expected depository only institutions would be able to cover their costs through development of a debit card network and direct deposit of money supply expansions on a pro rata basis from "Labour Dividends" otherwise known as seigniorage.

EU Economic Recovery Plan

Fractional Reserve Analysis with 2% ECB Reserve Requirement (Example)

(a) No Financial Intermediary to 2% ECB Reserve Requirement

No Financial Intermediary Analysis

When no financial intermediary is involved, intermediation must be real direct asset lending. In this example, Farmer B as Intermediary lends Farmer A a tractor to use for €500. Farmer A rents the tractor from Farmer B and grows a crop which is sold. In this system €1,500 of wealth is created from crop sale split €1,000 to Farmer A and €500 to Farmer B for use of the tractor with financial intermediary not participating at €0.

I. No Financial Intermediary (Real Asset Tractor Lending)					
	Farmer A	Farmer B	Intermediary	Total	
Start (Cash)	€ 495	€ 495	€ 10	€ 1,000	Begin Cash

2% Fractional Reserve Financial Intermediation Analysis

In this 2% fractional reserve system the Financial Intermediary adds a €500 loan into the system 98% (1-reserve requirement) backed by no real or financial assets, increasing fractional reserve returns by €490 to €1,990 from the sale of the exact same crop now split €975 to Farmer A, €500 to Farmer B and €515 to the intermediary that added 2% real credit. Farmer A pays back a €500 loan and pays interest of €25 for 2% (€10) of true credit intermediation. In the real world Farmer A would not borrow money this way unless he thought he was getting something, in this case Farmer A might take this type of loan to maintain some liquidity during the growing period before crop harvest. The Financial Intermediary loan captures 25.88% of the system earnings in the form of inflation and interest in a 98% direct transfer of wealth since the same crop is produced.

Fractional Reserve Intermediation Analysis

In this system Wealth Transfer is (Loan Principal + Interest) x (1- Reserve Requirement). Inflation is Principal portion of wealth transfer. In a 0% reserve system 100% of the loan repayment results in inflation with interest payments as direct wealth transfer without added inflation. In a 100% reserve system there is no inflationary wealth transfer and 100% of the interest earned is true credit intermediation.

Monetary Definitions from ECB Monetary analysis at <http://www.ecb.int/mopo/strategy/monan/html/index.en.html>

M1 (Narrow money) includes currency, i.e. banknotes and coins, as well as balances which can immediately be converted into currency or used for cashless payments, i.e. overnight (demand) deposits.

M2 ("Intermediate" money) comprises M1 plus deposits with a maturity of up to two years and deposits redeemable at a period of notice of up to three months. Depending on their degree of moneyness, such deposits can be converted into components of narrow money, but in some cases there may be restrictions involved, such as the need for advance notification, delays, penalties or fees. The definition of M2 reflects the particular interest in analysing and monitoring a monetary aggregate that, in addition to currency, consists of deposits which are liquid.

M3 (Broad money) comprises M2 and marketable instruments issued by the MFI sector. Certain money market instruments, in particular money market fund (MMF) shares/units and repurchase agreements are included in this aggregate. A high degree of liquidity and price certainty make these instruments close substitutes for deposits. As a result of their inclusion, M3 is less affected by substitution between various liquid asset categories than narrower definitions of money, and is therefore more stable.

European Central Bank (ECB) Intermediation Cost Estimate

Intermediation cost percentage estimated as [Money Stock (M1) increase x (1 - Reserve Requirement) + ECB net operating cost] divided by [GDP(Euro 17)].

Notes

- 1-M1 (Narrow money) includes currency, i.e. banknotes and coins, as well as balances which can immediately be converted into currency or used for cashless payments, i.e. overnight (demand) deposits. (Does not include time deposits or money market funds as they are not demand deposits.)
- 2-ECB net operating costs estimated from Attachment 5 as: 1) Staff + 2) Administrative + 3) Depreciation. (Banknote costs not included as assumed needed with or without ECB intermediation.)

NOTES

- UniCredit considered representative Eurozone bank. Bank conversion into depositor owned depositories and intermediation bank is a general estimation and not intended as a detailed plan.
- Short-term reserves for non-demand deposit accounts estimated at 100% to handle activity until conversion to CD's or transfer to depositor owned depositories. Reserves included with loan from Eurozone gov'ts.
- Government and Central Bank securities would be retired at par (no impairment) as a book entry and netted with government borrowing required to fully fund cash demand deposit accounts.
- Savings accounts at UniCredit converted to time deposits such as CD's or transferred to new Depository within a reasonable transition period, say up to three months.
- Bonded debt to sovereign national governments at market rate for equivalent debt secured by Loan Assets and/or other assets and would be repaid as loans payoff, est. at 0.25% premium over risk free rate.
- Some "Other Liabilities" may be considered demand liabilities, in which case they would require 100% reserves also and transfer to the new Depository Institution.
- Start-up for depository locations and FF&E estimated % of Asset 120. Property, plant and equipment at 50.0%

NOTES

- 1-General estimation of Eurosysteem Central Banks conversion into domestic Treasury owned depositories by capital key % and remaining sunset banks.
- 2-Government and monetary related assets would be credited and retired against Euro Notes which would be booked at par for new Euro Bills issued by the people.
- 3-Investment sales and loan payoffs and would be credited to Eurosysteem remaining banks/governments and retired.
- 4-Some "Other Liabilities" may be considered deposit liabilities, in which case they would require 100% reserves also and transfer to the new Treasury Deposit Institution.
- 5-Domestic Depository Banks would be assigned to national Treasury Departments according to ECB capital key % holdings.
- 6-Remaining operations of the Eurosysteem would be assigned to domestic Ministries of Commerce according to capital key percentages and/or sunset.

Notes

1-Assume country where deposits held benefits from 100% reserve conversion, not country of bank origin in case of foreign controlled bank holding deposits in domestic Eurozone country. Bank note likely overestimated since some deposits likely time deposit

Bank holdings of sovereign debt could also be credited and retired at par to reduce required bank borrowing.

2-Blank cell indicates data not available.

3-INDIC_NA Codes used for Asset and Liability line item identification.

Notes

a-Ignores ECB holdings of sovereign debt which are expected to also be credited to 100% reserve deposit funding and retired.

b-Negative sovereign liability number indicates excess available, possibly to fund unfunded liabilities and/or other citizen priorities.

Notes

1-It is expected sovereign debt holdings by banks will be credited and retired for use in funding full reserve deposits. The amount of sovereign debt holdings by banks is unknown but should net with reduced

bank loan keeping total benefit to people/nations at about the same level. Bank debt to sovereign governments should have a first lien position at the same market rate based on credit of entire Eurozone.

2-Bank debt from full reserve deposit conversion appears more than sovereign national debt for most countries. Consideration might be given to divvying excess to European citizens depository accounts or funding unfunded government liabilities.

There is no economic reward for monetary leverage from M&M Theorem. (Corollary, risk free rate should be GDP growth rate, not gov't debt rate.)

The Eurozone fractional reserve monetary system has a 92% (1 - RR) intermediation cost (wealth transfer effect) of new money creation. This is a loss of capital to the other sectors of the economy. Assuming a €750,000 of capital value per job creation, the average €7.286 trillion capitalized cost represents an estimated 9,715,000 private sector jobs. Per NY Times estimate the €291.5 billion annual cost would be approximately 12,117,000 jobs. These estimates indicate the approximate cost of ECB monetary intermediation is on the order of 10+ million jobs.

EU Economic Recovery Plan

Direct Issuance and First Use (Seigniorage) Money Supply Intermediation to European People (Estimated)

Euro €M1¹ Money Stock Basis Assumed

Initial Conditions

Initial conditions would be to take GDP of economy in base year and divide it by itself and call the result 100 and the same for the money stock, take the chosen money stock indicator and divide it by itself and call it 100. Then, one possible way to allocate the productivity increase of the economy back to the economy itself in the most direct, efficient and least costly way would be for any increases in the money stock to be directly credited by the government as interest/Labour Dividend pro rata to the accounts held at the new 100% cash depositories. In theory if the economy grows at a 2% rate then 2% interest would be credited to the demand deposit accounts. In recessionary cycles, if any, no interest/Labour Dividend would be paid. In that sense these 100% reserve checking accounts would appear to earn interest/Labour Dividends and be the same as today's fractional reserve checking accounts that are paying effectively no interest in recessionary periods and some interest in expansionary periods. There would be no need for deposit insurance because the depository would have 100% cash and demand deposits - it would not be possible for such a depository to not have 100% fund on hand to cover any withdrawal situation including up to 100%. Commercial Banks would no longer take demand deposits but could take CDs and make time matched funding loans and lend their own capital and continue to offer other financial services without government sponsored Insurance.

Formula

If economy decline, no Labor Dividend until fully recovered to avoid inflation.

$$\begin{aligned} \text{[% Change MS}_N] &= \frac{[MS_N - MS_{N-1}]}{[MS_{N-1}]} = \frac{\text{Money Stock}_0 \times \text{GDP}_N - 1}{\text{Money Stock}_{N-1} \times \text{GDP}_0} \\ \text{[Labour Dividend (LD)]} & \quad \text{[Seigniorage]} \\ \text{Provided [GDP}_N] & \text{ greater than any previous [GDP}_X] \text{ in the series 0 to N-1, if not then [% Change MS}_N] = 0\% \end{aligned}$$

Where

MS =Money Stock (M1 "Narrow Money" Used)
 GDP =Gross Domestic Product, measure of economic performance
 N = Year, (period between measurements used)
 LD =Labour Dividend [Seigniorage or Interest]

EU Economic Recovery Plan**Historical Support for 100% Full Reserve Demand Deposit Banking**

All of the persons listed supported a 100% reserve banking system and although many likely had different versions of the exact structure such a system might have they were all supportive of 100% reserve (time matched lending without money creation ability) banking. One version known as "The Chicago Plan" primarily by Henry Simons was supported by hundreds of economists in the 1930's and further developed by Irving Fisher.

Nobel Prize Winners

- | | |
|--------------------|---|
| 1 Milton Friedman | Nobel Prize Economics 1976, Economics Professor primarily University of Chicago. |
| 2 James Tobin | Nobel Prize Economics 1981, Economics Professor Yale and Harvard, (March 5, 1918 – March 11, 2002) |
| 3 Maurice Allais | Nobel Prize Economics 1988, Economics Professor, École Nationale Supérieure des Mines de, Paris (May 31, 1911 – October 9, 2010) |
| 4 Merton H. Miller | Nobel Prize Economics 1990 for discovery of M&M Theorem, Economics Professor primarily University of Chicago in "Do the M&M propositions apply to Banks?" Journal of Banking & Finance 19, 1995. |
| 5 Frederick Soddy | Nobel Prize Chemistry 1921 (believed to be first discover of 100% reserve principle in 1926, author 1934 <i>The Role of Money</i> pp. 67-68 quote "[Fractional Reserve] Banks have never been solvent". |

Bankers

- | | |
|----------------------|---|
| 1 Frank A. Vanderlip | President National City Bank (1909-1919) (now Citicorp), Assistant Secretary of Treasury (1891-1901) and member of original Jekyll Island Conference for the creation of the Federal Reserve System (1864 – June 30, 1937). |
| 2 Alexander Efron | Originated no minimum balance checking known as Checkmaster Plan while Vice President National Safety Bank & Trust, New York, (1893 – December 24, 1950). |
| 3 Mervyn King | Current governor of the Bank of England, England's Central Bank in "Banking: From Bagehot to Basel, and Back Again" Speech at Buttonwood Gathering, New York City, Monday October 25, 2010. |

Economists

- | | |
|----------------------------------|--|
| 1 Irving Fisher | Economics Professor, Yale, one of the most respected economists from the first half of the 20th century advocated for 100% reserve system from 1934 for the remainder of his life (1867-1947). |
| 2 Richard A. Werner | International Banking Professor, University of Southampton, England |
| 3 Joseph Huber | co-author with James Robertson of <i>Creating New Money: A Monetary Reform for the Information Age</i> , 2000, chair of economic and environmental sociology at Martin Luther University of Halle-Wittenberg, Germany (1948-). |
| 4 James Robertson | co-author with Joseph Huber of <i>Creating New Money: A Monetary Reform for the Information Age</i> , 2000, British political and economic thinker/activist (born August 11, 1928). |
| 5 Jesús Huerta de Soto Ballester | Economics Professor, Rey Juan Carlos University, Madrid, Spain (December 23, 1956 –) |
| 6 Jörg Guido Hülsmann | Economics and Law Professor, Université d'Angers, Angers, France |
| 7 Herman E. Daly | Economics Professor, University of Maryland, author in 2007 of "Ecological economics and sustainable development: selected essays of Herman Daly", p.114. |
| 8 Laurence Jacob Kotlikoff | Economics Professor, Boston University (January 30, 1951 –) |
| 9 Lauchlin Currie | Assistant to Former Federal Reserve Chairman Marriner Eccles during Roosevelt administration (October 8, 1902 – December 23, 1993). |
| 10 Murray Rothbard | Notable Austrian School Economist (March 2, 1926 – January 7, 1995) |
| 11 Ludwig von Mises | Prominent Early Austrian School Economist (September 29, 1881 – October 10, 1973) |
| 12 Henry C. Simons | Economics and Law Professor, U. Chicago and a primary author of the "Chicago Plan" 100% banking reserves plan letter March 1933 on file in Roosevelt Library in Hyde Park, NY. |
| 13 Garfield V. Cox | Finance Professor and Dean of the Chicago School of Business (1945-52), signed 100% banking reserves letter March 1933 on file in Roosevelt Library in Hyde Park, NY. (May 4, 1893 –) |
| 14 Aaron Director | Economics and Law Professor, U. Chicago signed 100% banking reserves letter March 1933 on file in Roosevelt Library in Hyde Park, NY (1901 – September 11, 2004). |
| 15 Albert Gailord Hart | Economics professor at Columbia University, supported "Chicago Plan" signing March 1933 Letter on file in Roosevelt Library in Hyde Park, NY. |
| 16 Frank H. Knight | Economics Professor, U. Chicago (1922-52) signed 100% banking reserves letter March 1933 on file in Roosevelt Library in Hyde Park, NY (November 7, 1885 - April 15, 1972). |
| 17 Lloyd W. Mints | Economics professor, U. Chicago signed 100% banking reserves letter March 1933 on file in Roosevelt Library in Hyde Park, NY (1888 –) |
| 18 Henry Schultz | Economics professor, U. Chicago signed 100% banking reserves letter March 1933 on file in Roosevelt Library in Hyde Park, NY (September 4, 1893 – November 26, 1938). |
| 19 Frank D. Graham | Economics and International Finance Professor Princeton (1890-1949). Frank D. Graham Memorial Lecture at Princeton is named in his honor. |
| 20 Charles R. Whittlesey | Economics professor at Princeton and Wharton School, U. Penn (1900-79). |
| 21 Richard A. Lester | Labor Economics Professor and Former Chairman Princeton Department of Economics author "Gold Money, Bank Money, and Real Money" VQR Spring 1941 (March 1, 1908 – December 31, 1997). |
| 22 Earl J. Hamilton | Economics Professor Duke (1927-44) and U. Chicago (1947-67), also editor of the Journal of Political Economy for seven years and president of the Economic History Association 1951-52. (1899 – 1989). |
| 23 Willford I. King | Economics Professor, NYU 1927-45 (1880–1962). |
| 24 Charles O. Hardy | Associate Economist at Fed during Marriner Eccles Roosevelt era Chairmanship, fellow at Brookings Institution and author including "Credit Policies of the Federal Reserve System in 1932. |
| 25 John R. Commons | Economics Professor and Labor Historian University of Wisconsin-Madison (October 13, 1862 – May 11, 1945). |
| 26 James W. Angell | Economics Professor Columbia University (1898-1986). |
| 27 American Economic Association | Leading economics society in the world, 1937 poll by Irving Fisher indicated 1,100 members had signed approval of 100% reserve banking with 96 indicating specific reservations. |

Government Members

- | | |
|------------------------|--|
| 1 Robert L. Owen | U.S. Senator (D-OK) 1907-25, Chairman Senate Committee on Banking and Currency (1913-1919) and Senate sponsor of the Glass-Owen Bill (H.R. 7837) which became the Federal Reserve Act signed into law 12/23/1913, (February 2, 1856 – July 19, 1947). |
| 2 Henry Wallace | 33rd Vice President of the United States, Secretary of Agriculture and Secretary of Commerce under Roosevelt Administration |
| 3 Paul Howard Douglas | U.S. Senator from Illinois 1948-66 and former Univ of Chicago economics professor supported 100% reserve banking including co-authoring <i>A Program for Monetary Reform</i> in July 1939 (March 26, 1892 – September 24, 1976). |
| 4 Bronson Cutting | U.S. Senator from New Mexico (interim 1928 and 1929-35) introduced 100% reserve banking legislation in Senate June 6, 1934 (S. 3744)(June 23, 1888 – May 6, 1935). |
| 5 Wright Patman | U.S. Congressman (D) from 1st District Texas (1929-1976) and chair of the House Committee on Banking and Currency (1965–75) introduced legislation in House in 1934 (H.R. 9855)(August 6, 1893 – March 7, 1976). |
| 6 Jerry Voorhis | U.S. Congressman (D) from 12th District California 1937-1947. Voorhis supported 100% reserve banking and teamed with Wright Patman to force Fed to pay most interest earned on federal securities to the U.S. Government (April 6, 1901 – September 11, 1984). |
| 7 T. Alan Goldsborough | U.S. Congressman (D) from 1st District Maryland (1921-1939) introduced legislation to end fractional reserve banking system in 1937 (HR 31) (September 16, 1877 – June 16, 1951). |
| 8 Ron Paul | U.S. Congressman from 14th District Texas and two time Republican candidate for President. |
| 9 Dennis J. Kucinich | U.S. Congressman from 10th District Ohio. |
| 10 Douglas Carswell | MP in British Parliament |

Notable Historic Supporters

- | | |
|----------------------|--|
| 1 David Hume | One of the most important figures in the history of Western philosophy in <i>Of Money</i> 1752. |
| 2 Thomas Edison | Greatest Inventor of 20th Century (February 11, 1847 – October 18, 1931). |
| 3 Robert de Fremery | Respected financial writer and author of <i>Money and Freedom</i> 1955. |
| 4 Gertrude M. Coogan | First woman to receive MBA from Northwestern, earned in 1922 with special honors and author of <i>Money Creators</i> 1935. |

Attachment 14

EU Economic Recovery Plan

Formulas

Symbol Key

GDP	=	Gross Domestic Product (€), Eurozone (17) measure of economic output of economy.
MS	=	Money Stock (€) at end given period N (M1 "Narrow Money" used for calculations)
N	=	Last Observation in series 0 to N, assumed year but could be quarterly or other selected period
RR	=	% Reserve Requirement for ESCB Member Banks. [% demand deposit accounts banks must hold in reserve for withdrawals from demand deposit (checking/debit card type) liabilities]
X	=	Any specific observation in series 0 to N

Annual Intermediation Cost (€) of ESCB/ECB/NCB Banking System Estimate

$$= [(MS_N) - (MS_{N-1})] \times [1 - RR(\%)] + [\text{Net Annual Operating Expenses}]$$

Annual Intermediation Cost (%) of ESCB/ECB/NCB Banking System Estimate

$$= \frac{[(MS_N) - (MS_{N-1})] \times [1 - RR(\%)] + [\text{Net Annual Operating Expenses}]}{[GDP_N]}$$

Economy Increase/Change Formula

$$[\% \text{ Change } GDP_N] = \frac{[GDP_N - GDP_{N-1}]}{[GDP_{N-1}]}$$

Money Stock Increase Formulas

$$[\% \text{ Change } Money \text{ Stock}_N] = \frac{[Money \text{ Stock}_0] \times [GDP_N] - 1}{[Money \text{ Stock}_{N-1}] \times [GDP_0]}$$

[Labour Dividend]
[Interest]
[Seigniorage]

Provided if [% Change Money Stock_N] less than 0%, then 0%.

(Positive growth condition, [GDP_N] must be greater than any previous [GDP_X] in the series 0 to N-1 for Payment of Labour/Productivity Dividend)

Money stock increase will remain at zero [Money Stock_{N-1}] until economy fully recovered from GDP decline. Since people receive seigniorage, creation and first use of new money, directly on a pro rata basis there is no economic benefit of inflating the money stock during periods of economic decline. [Money stock is increased now via direct wealth transfer from the other sectors of the economy to recapitalize the banking system, making recessions worse for everyone but the banking sector.]

$$[Money \text{ Stock}_N] = [Money \text{ Stock}_{N-1}] \times \frac{[GDP_N]}{[GDP_{N-1}]}$$

Provided if [% Change Money Stock_N] less than 0%, then [Money Stock_N] = [Money Stock_{N-1}].

(Positive growth condition, [GDP_N] must be greater than any previous [GDP_X] in series 0 to N-1 for [Money Stock_N] increase)

Notes

1-ECB Consolidated banking data - Reference period: end-2011 - Table 11a - Country-level indicators: selected balance sheet items, used to prepare this spreadsheet. Original Table 11a contains selected banking data for all 27 countries in the EU (summarized in Table 4) which was reduced to the 10 countries in the EU not using the Euro. Table 11a - Country-level indicators: selected balance sheet items, does not provide complete banking balance sheet data so three plug figures were used for missing data to balance asset and liabilities totals that were provided. The key items of cash, investments and deposits were provided which should provide a good estimate of bank's 100% conversion loan from sovereign nations.

2-ECB Consolidated banking data - Reference period: end-2011 - Table 8 - Country-level indicators: consolidated banking data reporting population. Table 8 banking data reduced to 10 countries not using Euro in the EU.

3-It may be possible that some [A4] Financial assets designated at fair value through profit or loss, if it is Eurozone sovereign debt, could be revalued up and redeemed at par for conversion to 100% demand deposit funding, reducing the bank note needed.

4-Held to maturity investments, if sovereign government debt, should be redeemable at par and retired for conversion to 100% demand deposits, since would reduce debt bank would need to borrow from sovereign to fund demand deposits.

a-Assume country where deposits held benefits from 100% reserve conversion, not country of bank origin in case of foreign controlled bank holding deposits in domestic Eurozone country. Bank note likely overestimated since some deposits likely time deposit

Notes

1-ECB Consolidated banking data - Reference period: end-2011 - Table 11a - Country-level indicators: selected balance sheet items, used to prepare this spreadsheet. Original Table 11a contains selected banking data for all 27 countries in the EU (summarized in Table 4) which was reduced to the 10 countries in the EU not using the Euro. Table 11a - Country-level indicators: selected balance sheet items, does not provide complete banking balance sheet data so three plug figures were used for missing data to balance asset and liabilities totals that were provided. The key items of cash, investments and deposits were provided which should provide a good estimate of bank's 100% conversion loan from sovereign nations.

2-ECB Consolidated banking data - Reference period: end-2011 - Table 8 - Country-level indicators: consolidated banking data reporting population. Table 8 banking data reduced to 10 countries not using Euro in the EU.

3-It may be possible that some [A4] Financial assets designated at fair value through profit or loss, if it is Eurozone sovereign debt, could be revalued up and redeemed at par for conversion to 100% demand deposit funding, reducing the bank note needed.

4-Held to maturity investments, if sovereign government debt, should be redeemable at par and retired for conversion to 100% demand deposits, since would reduce debt bank would need to borrow from sovereign to fund demand deposits.

5-Start-up for depository locations and FF&E estimated % of A9 Tangible & intangible assets 50.0% Also assigned depositories matching amount of bank L11 Total debt certificates, reducing remaining commercial bank debt by matching amount.

6-Sweden deposit data not reported.

a-Assume country where deposits held benefits from 100% reserve conversion, not country of bank origin in case of foreign controlled bank holding deposits in domestic Eurozone country. Bank note likely overestimated since some deposits likely time deposit

Notes

1-ECB Consolidated banking data - Reference period: end-2011 - Table 11a - Country-level indicators: selected balance sheet items, used to prepare this spreadsheet. Original Table 11a contains selected banking data for all 27 countries in the EU (summarized in Table 4) which was reduced to the 10 countries in the EU not using the Euro. Table 11a - Country-level indicators: selected balance sheet items, does not provide complete banking balance sheet data so three plug figures were used for missing data to balance asset and liabilities totals that were provided. The key items of cash, investments and deposits were provided which should provide a good estimate of bank's 100% conversion loan from sovereign nations.

2-ECB Consolidated banking data - Reference period: end-2011 - Table 8 - Country-level indicators: consolidated banking data reporting population. Table 8 banking data reduced to 10 countries not using Euro in the EU.

3-It may be possible that some [A4] Financial assets designated at fair value through profit or loss, if it is Eurozone sovereign debt, could be revalued up and redeemed at par for conversion to 100% demand deposit funding, reducing the bank note needed.

4-Held to maturity investments, if sovereign government debt, should be redeemable at par and retired for conversion to 100% demand deposits, since would reduce debt bank would need to borrow from sovereign to fund demand deposits.

5-Start-up for depository locations and FF&E estimated % of A9 Tangible & intangible assets at 50.0% Also assigned depositories matching amount of bank L11 Total debt certificates, reducing remaining commercial bank debt by matching amount.

a-Assume country where deposits held benefits from 100% reserve conversion, not country of bank origin in case of foreign controlled bank holding deposits in domestic Eurozone country. Bank note likely overestimated since some deposits likely time deposit

Notes

1-Assume country where deposits held benefits from 100% reserve conversion, not country of bank origin in case of foreign controlled bank holding deposits in domestic Eurozone country. Bank note likely overestimated since some deposits likely time deposits. Bank holdings of sovereign debt could also be credited and retired at par to reduce required bank borrowing.

2-Blank cell indicates data not available.

3-INDIC_NA Codes used for Asset and Liability line item identification.

Notes

a-Ignores ECB holdings of sovereign debt which are expected to also be credited to 100% reserve deposit funding and retired.

b-Negative sovereign liability number indicates excess available, possibly to fund unfunded liabilities and/or other citizen priorities.

c-Sweden ECB banking data incomplete, further Sweden banking data needed to make monetary conversion loan estimate.

d-UK ECB banking data indicates enough For Sale Assets available to fully fund demand deposits but some or all may be pledged and not available.

Notes

- 1-It is expected sovereign debt holdings by banks will be credited and retired for use in funding full reserve deposits. The amount of sovereign debt holdings by banks is unknown but should net with reduced bank loan keeping total benefit to people/nations at about the same level. Bank debt to sovereign governments estimated to be first lien at the same market interest rate for all banks based on the credit of the entire Eurozone + a risk premium.
2-Bank debt from full reserve deposit conversion appears more than sovereign national debt for most countries. Consideration to divesting excess to European citizens depository accounts or unfunded government liabilities.

III. Monetary Debt Est.	€103.86	€2,596.48	4,318,113	3,461,977
Average	€71.39	€1,784.85	2,968,312	2,379,795

The EU/EMU fractional reserve monetary system has an average 92% (1 - RR) intermediation cost (wealth transfer effect) of new money creation. This is a loss of capital to the other sectors of the economy. Assuming a €750,000 Euro of capital value per job creation, the average €1.78 Trillion capitalized cost represents an estimated 2,380,000 private sector jobs. Per NY Times estimate the €71.4 Billion annual cost would be approximately 2,968,000 jobs. These estimates indicate the approximate cost of monetary intermediation is on the order of 3 million jobs.
